

Analysis of A/B Test Results

Data Scientist: Christian

Agenda

Findings of A/B test analysis

- Experiment Setup
- Conversion Rates
- Experiment Results

How Was the Experiment Implemented?

Total Variant Visitors: 35,211

Total Control Participants: 34,678

Visitors by Country (US: 48,850 · UK: 17,551 · CA: 3,488)

Conversion Rates

	U.S.	U.K.	CA
Control	10.7%	10.2%	9.4%
Treatment	15.8%	14.9%	15.4%

Executive Summary: The treatment page consistently outperforms control across all three countries (a 4.7–6.0 point lift). Country alone shows little relationship with conversion — rates are within ~1 point of each other under the same page — suggesting treatment, not geography, drives the difference.

Experiment Results

- Treatment Conversion Rate: 15.5%
- Control Conversion Rate: 10.5%
- Delta in Treatment vs. Control Conversion Rate: +5.0 percentage points (treatment higher)
- p-value: 0.0 (0 of 500 simulated null differences exceeded the observed difference)
- Conclusion:
 - With a p-value of 0.0, well below our significance threshold of 0.05, we reject the null hypothesis. The observed 5-point conversion lift for the treatment page is highly unlikely to be due to chance. This provides strong statistical evidence that the treatment page outperforms the control page, and the company should proceed with implementing the new (treatment) page.
